Prepared using doors2ai Agentic AI Detailed Course Material v1.0 as primary source.

PART 1 — Market Research Summary

Market Context

The AI bootcamp market in 2025 is dominated by a handful of large players, but it has a clear structural gap: most programs teach either data science (statistics, ML models) or generic GenAI tool usage — not structured AI engineering from beginner to production. No competitor currently offers a beginner-safe, fully sequenced curriculum that takes a learner from zero Python to enterprise-grade multi-agent systems including governance, typed state design, LangGraph orchestration, and a defensible capstone project.

Key Market Observations

- BrainStation offers 400-hour immersive programs covering neural networks and LLMs with instructors from Amazon and Meta — targeting learners who already have some technical background. Price: \$2,950–\$16,500.
- Springboard's ML/AI track costs ~\$9,000–\$9,900 over 26 weeks. It requires prior data analysis experience and targets working professionals, not absolute beginners.
- General Assembly and Le Wagon are strong on career support and community but are not focused on agentic AI system design.
- DataCamp and Coursera offer self-paced subscriptions at low cost but without structured cohorts, accountability, or system-level capstone requirements.
- Turing College offers LangChain and agent topics but requires prior programming experience — not a true beginner track.
- The clear gap: a sequenced, beginner-safe path from Python basics through RAG, LangGraph, MCP, and multi-agent orchestration does not exist elsewhere.

"doors2ai positions below competitors in prerequisites, above them in agentic AI curriculum depth."

PART 2 — Competitor Comparison Table

Provider	Audience	Price	Duration	Differentiators	Weakness	doors2ai Opportunity
BrainStation	Career changers, \$2,950–\$16,500	12 wks full-time	Global campuses, industry instructors	Requires prior coding/data science	Beginner-friendly agentic AI track	
Springboard	Working professionals, \$9,000–\$9,900	26 wks	1:1 mentorship, job guarantee	No dedicated AI engineering track; LLM/MCP, not systems	Mostly agents for business	
General Assembly	Beginners to career, \$12,000–\$15,000	12 wks	Flexible financing, strong brand	Broad career services, no Agentic AI specialization	Specialized positioning vs 'general'	
Coursera / edX	Self-paced online, \$49–\$399/mo	Self-paced	University partnerships, low cost	No cohort; no system design; live capstone gaps	Delivery	
DataCamp	Data professionals, \$25–\$60/mo	Self-paced	Affordable, interactive exercises	No structured AI engineering path; unstructured	Specialized, focused curriculum with clear outcomes	
Le Wagon	Career changers, \$7,000–\$12,500	9–24 wks	Hands-on, 87% job placement	Data/ML focus, not high dev for AI; no agentic	Post-graduated AI engineering track	
Turing College	Experienced programmers, similar range	3–4 months	LangChain + AI agents, self-paced	Requires programming experience	True beginner track for Agentic AI	

PART 3 — doors2ai Positioning Strategy

MARKET GAP

No competitor offers a beginner-safe, fully sequenced curriculum from zero Python to enterprise-grade multi-agent systems — including governance (MCP), typed state design, LangGraph orchestration, and a defensible capstone project.

UNIQUE SELLING PROPOSITION

"The only bootcamp that teaches you to design AI systems you can defend — not just run."

POSITIONING STATEMENT

"doors2ai is a structured AI engineering bootcamp for absolute beginners. We take you from no experience to building governed, production-ready Agentic AI systems — in a single locked curriculum path."

IDEAL LEARNER PERSONA

Career changer or early-career professional, 22–40 years old, no coding background, curious about AI, frustrated by scattered tutorials, wants structure and real outcomes. May be in Toronto or remote. Motivated by career transition into AI or tech roles.

PART 4 — Improved Website Structure

Recommended Navigation

Page	Purpose	Key Sections
Home	First impression + conversion	Hero, Why doors2ai, Learning Path, Programs, Outcomes, CTA
Programs	Track breakdowns	3 tracks: Frontend, Full Stack, Agentic AI — each with full curriculum detail
Curriculum	Module explorer	Tabbed: Foundations / Core AI Stack / Advanced & Capstone
Pricing	Conversion	Pricing by program, payment options, FAQs
About	Credibility	Mission, Teaching Philosophy, Founder, Team
FAQ	Objection handling	Common questions answered directly
Blog (optional)	SEO + authority	AI explainers, system design posts, curriculum thinking

Key Structural Improvements

- Consolidate the hero into a single clear positioning statement — not a feature list.
- Lead every page with one strongest claim, then support it below.
- Add a 'learning path' section showing the logical progression: Frontend → Full Stack → Agentic AI.
- Place trust signals (module count, capstone outcomes) near the hero, not buried in footers.
- End every page with a unified CTA block: Apply Now + secondary action.

- Use consistent section labels (small uppercase, brand green) to create visual rhythm between content blocks.

PART 5 — Updated Homepage Content

HERO SECTION

Headline: From beginner to AI engineer — the structured path.

Supporting copy: doors2ai is a structured AI engineering bootcamp built for people with no prior experience. Learn Python, Prompt Engineering, RAG, LangChain, LangGraph, and Multi-Agent systems — and ship real systems.

Primary CTA: Explore Programs

Secondary CTA: View Curriculum

Meta line: No CS degree required · Beginner to production-ready · Cohort-based learning

TRUST BAR (below hero)

- 12 structured modules
- Python → LangGraph → Multi-Agent
- Enterprise capstone project
- MCP governance training

WHY DOORS2AI — 4 PILLARS

Structured, not scattered — 12 locked modules in a deliberate sequence. Each module prepares you for the next.

Beginner to production — We start from zero and end at enterprise-grade agentic systems you can defend.

Real system design — Capstone projects require typed state, LangGraph orchestration, RAG, and MCP governance.

No 'magic' thinking — We correct LLM misconceptions early. You'll know exactly what agents can and can't do.

LEARNING PATH SECTION

Track 01 — Frontend Engineering	Track 02 — Full Stack Development	Track 03 — Agentic AI Engineering
HTML, CSS, JS, TypeScript, React, Next.js. Build production-ready UIs.	Python, PostgreSQL, Redis, Docker, AWS. Build full applications with logic.	Python, RAG, LangChain, LangGraph, MCP, Multi-Agent systems.
8 weeks	10 weeks	14 weeks

OUTCOMES STRIP

12 Modules	1 Enterprise Capstone	6+ Projects Shipped	0 Prior Experience Needed
------------	-----------------------	---------------------	---------------------------

FINAL CTA BLOCK

Headline: Ready to build real AI systems?

Copy: Join doors2ai and go from beginner to Agentic AI engineer — with a curriculum designed for real-world impact.

Primary CTA: Apply Now | **Secondary:** Download Curriculum PDF

PART 6 — Curriculum Page Proposal

The curriculum page uses a three-tab structure. Each tab shows module cards with title, duration, key topics, and learning outcome. All 12 modules are derived directly from the locked curriculum document.

TAB 1 — FOUNDATIONS

Module 0	Environment Setup for Agentic AI	60–90 min · One-time
- Python installation (with OS-specific guides) - VS Code + required extensions - Virtual environments (concept + setup) - First successful Python run		
Module A	Python for Agentic AI	~3 weeks · Absolute beginner
- Variables as agent memory - Strings & prompt construction - Lists, dicts, sets, tuples (agent state) - Control flow as guardrails - Functions as agent capabilities - Errors and safe failure patterns		
Module A+	Type Annotations for Agent State	1 week · Bridge module
- Why types matter in agent systems - Optional & Union types - TypedDict state blueprints (pre-LangGraph)		

TAB 2 — CORE AI STACK

Module B	LLMs & Prompt Engineering	~2 weeks
	• What LLMs are and are not • Prompt anatomy (role, instruction, context, constraints, output) • Output control & formatting • Hallucination mitigation strategies • Zero-shot, few-shot, chain-of-thought patterns	
Module C	Embeddings & Semantic Search	~1 week
	• Meaning as vectors — beginner-safe explanation • Semantic vs keyword search • Embedding lifecycle end-to-end • In-memory semantic search (hands-on)	
Module D	RAG — Retrieval, Reasoning, Grounded Output	~2 weeks
	• Why RAG exists (LLMs don't 'know' your data) • Ingestion, retrieval, reasoning pipeline • FAISS (local), Chroma (dev-friendly), Pinecone (production) • RAG failure modes as design errors	
Module E	LangChain Orchestration	~2 weeks
	• Sequential, conditional, parallel chain patterns • RAG implementation with pluggable vector backends • Tools as callable capabilities • When NOT to use LangChain	

Module F	Agents — Mental Models & Examples	~1 week
	• Precise definition of an agent (not just an LLM) • What is NOT an agent • Levels of autonomy (0–3) • Guardrails & stop conditions	

TAB 3 — ADVANCED & CAPSTONE

Module G	LangGraph — Stateful Agent Workflows	~2 weeks
	• State machines for LLM systems (state, nodes, edges) • Typed state definition (TypedDict) • Conditional edges, loops, retries • Debugging & explainability • RAG inside LangGraph	

Module H	MCP — Context Boundaries & Governance	~1 week
	• Dangers of unbounded context • Context types: instruction, operational, knowledge, user, system • Permissions & capability control • Auditability and explainability requirements	

Module I	APIs, Tools, Streamlit, Git/GitHub	~1 week
	• APIs in agent systems • Streamlit for AI UIs • LangGraph + Streamlit integration • Git/GitHub for AI project versioning	

Module J	Advanced RAG	~1 week
	• Chunking strategies (fixed vs semantic) • Metadata-aware retrieval • Hybrid search (semantic + keyword) • Multi-stage retrieval & reranking	
Module K	Multi-Agent Systems & Orchestration	~2 weeks
	• Orchestration as control plane (not agent coordination) • Supervisor/Worker, Plan→Execute→Validate, Fan-out/Fan-in patterns • LangGraph as orchestrator • MCP governance at orchestration level • Multi-agent failure modes	
Module L	Enterprise Capstone Project	~2 weeks
	• Mandatory: typed state, LangGraph, RAG, MCP governance • Streamlit UI or API, GitHub repository • Multi-agent capstones: explicit orchestration layer required • Evaluated on architecture, control, governance, explainability, delivery	

PART 7 — Courses to Feature Prominently

Agentic AI Engineering Bootcamp	14 weeks
The flagship program. Python → Prompt Engineering → RAG → LangChain → LangGraph → MCP → Multi-Agent. Enterprise capstone required. Audience: Absolute beginners — no prior experience required Outcome: A defensible, runnable Agentic AI system on GitHub with typed state, governed orchestration, and retrieval	

Generative AI Foundations	4 weeks
Modules B–D as a standalone short course. LLMs, prompt engineering, embeddings, and RAG architecture — no coding required. Audience: Non-technical professionals, managers, product teams Outcome: Ability to design prompts, understand retrieval, and evaluate AI system outputs	
AI Engineering Foundations	6 weeks
Modules A–F. Python fundamentals plus correct agent mental models. Pre-requisite track for the full bootcamp. Audience: Career changers, non-developers wanting to enter AI engineering Outcome: Python fluency + agent reasoning ready for LangGraph and the full bootcamp	
Full Stack for AI Engineers	10 weeks
Frontend + backend + API integration, positioned as the delivery layer for AI systems. Audience: Developers wanting to build and ship AI-powered web applications Outcome: Deployable full stack app with AI integration	
Python for AI Beginners	3 weeks
Module 0 + Module A only. Zero to Python fluency, framed around AI control logic. Audience: Complete beginners — zero coding experience Outcome: Run Python confidently, understand agent control logic, ready for the full track	
Frontend for AI Applications	8 weeks
HTML/CSS/JS/React/Next.js, positioned as the UI layer for AI systems. Build portfolio-ready interfaces. Audience: Design or non-tech background, bootcamp pre-track Outcome: Portfolio-ready frontend capable of wiring to AI APIs	

PART 8 — About Page Content

MISSION

doors2ai exists to provide structured, honest AI engineering education for people who have no prior background — and to produce graduates capable of designing systems they can defend, not just tools

they can operate.

VISION

A world where anyone can learn to build governed, reliable AI systems — regardless of their starting point.

WHY DOORS2AI EXISTS

Most AI education in 2025 falls into two categories: expensive university programs that require years of prerequisites, or tutorial platforms that teach you to copy-paste without understanding. Neither prepares someone to build real agentic systems safely. doors2ai was built to close that gap.

TEACHING PHILOSOPHY

We correct misconceptions before building on them. We frame every concept in terms of production safety and real system behavior. We never treat LLMs as magic — we teach learners what they actually are, what they fail at, and how to design reliable systems around them. Concept first. Implementation second. Defence always.

HOW DOORS2AI DIFFERS FROM TUTORIAL PLATFORMS

Tutorial platforms teach isolated tools. doors2ai teaches a system. Every module in the curriculum is a deliberate preparation for the next. State, orchestration, retrieval, governance, and delivery are taught as one integrated discipline — not a playlist of disconnected videos.

TEACHING APPROACH

Concept-first, then implementation. Each module begins with 'why this exists' before any code. Failure modes are taught alongside capabilities. Every project is evaluated on whether it can be explained and defended — not just whether it runs.

CAREER FOCUS

Graduates are positioned for roles such as AI Engineer, Agentic AI Developer, AI Systems Designer, or LLM Application Developer — roles that are growing rapidly and currently underserved by traditional education.

FOUNDER SECTION

[Placeholder — Founder name, title, background in AI / teaching / industry engineering. Why they built doors2ai. What they've seen the industry get wrong about AI education.]

Photo placeholder: circular avatar, 80x80px.

FUTURE ROADMAP

Planned expansions include a part-time cohort format, a corporate training track, advanced electives in fine-tuning and evaluation, and a mentorship network for graduates.

PART 9 — Website Mockup Structure

The interactive mockup (delivered separately in the chat) shows the full layout for three pages. The section order and hierarchy for each page is specified below.

HOME PAGE — Section Order

- 1. Navigation — Logo · Program links · Apply Now CTA
- 2. Hero — Positioning headline · Supporting copy · Primary + Secondary CTA · Meta line
- 3. Trust bar — 4 short factual statements with teal dot indicators
- 4. Why doors2ai — 4 card grid (Structured / Beginner-to-production / Real system design / No magic thinking)
- 5. Learning Path — 3-step horizontal timeline (Frontend / Full Stack / Agentic AI)
- 6. Program Cards — 3 cards; Agentic AI featured with green border
- 7. Outcomes Strip — 4 metric cells (12 modules / 1 capstone / 6+ projects / 0 prior experience)
- 8. Testimonials placeholder — (add when available)
- 9. CTA Block — Apply Now + Download Curriculum PDF

CURRICULUM PAGE — Section Order

- 1. Navigation
- 2. Hero — Curriculum headline + positioning
- 3. Tab bar — Foundations / Core AI Stack / Advanced & Capstone
- 4. Module cards — Each card: module number, title, duration/level, key topics
- 5. Expand-to-detail buttons on each card
- 6. Bottom CTA Block

ABOUT PAGE — Section Order

- 1. Navigation
- 2. Hero — Mission statement headline
- 3. Mission + Vision cards (2-column)
- 4. Teaching Philosophy card
- 5. How doors2ai differs card
- 6. Founder section — Avatar + name + bio
- 7. Future Roadmap
- 8. CTA Block — Apply Now + Ask a Question

PART 10 — Design Improvement Suggestions

These suggestions work within the existing WordPress theme without redesigning it. All are additive adjustments to hierarchy, spacing, and emphasis.

TYPOGRAPHY HIERARCHY

Introduce one clear display size for H1 (36–40px, tracked slightly negative) versus body H2 at 22px. Use section labels at 11px uppercase with 1.2px letter-spacing in brand green to create rhythm between sections.

SPACING

Add consistent 48px vertical padding between sections. The hero section should breathe — minimum 64px top padding. Module cards benefit from 24px internal padding rather than tight 12px.

SECTION GROUPING

Group 'Why doors2ai' and 'Learning Path' into a single thematic block about curriculum philosophy. Separate this visually from the program cards block, which is conversion-focused.

BUTTON PLACEMENT

Place only one primary CTA per section. Secondary CTAs (Download PDF, View Curriculum) should always appear after the primary button, never before it. Every page ends with a CTA block.

VISUAL HIERARCHY

Use the single brand accent color (teal/green) sparingly — section labels, key metrics, active states, and the featured program card border only. Reserve it for 'this matters' moments.

COLOR USAGE

The white-on-dark hero variant works well for the flagship Agentic AI track. Use a light neutral background (off-white/cream) for the 'Why doors2ai' section to create contrast without new colors. Only the featured program card gets a green border — this differentiates it without new design elements.

TRUST SIGNALS

Add a thin horizontal strip just below the hero with 4–5 short factual statements. These reduce first-impression friction for visitors deciding whether to keep reading.

CREDIBILITY SECTIONS

Add instructor credentials and any industry recognition near the bottom of the homepage and curriculum page. Even placeholder slots signal that this will be populated — better than omitting entirely.
